                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          a disulfide bond (By similarity).

--- TISSUE SPECIFICITY: Plasma.

--- PTM: The vitamin K-dependent, enzymatic carboxylat glutamate residues allows the modified protein to similarity).

--- SIMILARITY: Belongs to peptidase family Sl.

---- SIMILARITY: Contains 2 EGF-like domains.

Exp. Med. Biol. 281:121-131(1990).

-i- FUNCTION: Circulates in the blood in a zymogen form. Factor VII is converted to factor VIIa by factor Xa, factor XIIa, factor IXa, or thrombin by minor proteolysis. In the presence of tissue factor and calcium ions, factor VIIa then converts factor X to factor X by limited proteolysis. Factor VIIa will also convert factor IX to factor IXa in the presence of tissue factor and calcium.

-i- CATALYTIC ACTIVITY: Hydrolyzes one Arg- |-ile bond in factor X to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence."

TISSUE SPECIFICITY: Liver and chorioallantoic membrane.

PIM: The vitamin K-dependent, enzymatic carboxylation of some glutamate residues allows the modified protein to bind calcium.

PIM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE EXTRINSIC PATHWAY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.
FUNCTION: VAP cleaves the fusion proteins of Sendai virus, NDV, and influenza virus a at a specific single arginine-containing site, and plays a key role in the viral spreading in the allantoic
                                                                                                                                                                                                                                                                                                          s SWISS-PROT entry is copyright. > Submitted (NOV-1996) to the EMBL/GenBank/DDBJ databases FUNCTION: Circulates in the blood in a zymogen form. Factor VII is converted to factor VIIa by factor Xa, factor XIIa, factor IXa, or SUBUNIT: Heterodimer of a light chain and a heavy chain linked CATALYTIC ACTIVITY: Hydrolyzes one Arg- | - Ile bond in factor X to by limited proteolysis. Factor VIIa will also convert factor IX to and calcium ions, factor VIIa then converts factor X to factor Xa thrombin by minor proteolysis. In the presence of tissue factor factor IXa in the presence of tissue factor and calcium (By

PTM: The vitamin K-dependent, enzymatic carboxylation of glutamate residues allows the modified protein to bind ca calcium some (By

                                                                                                                                                                                                                                 SUBUNIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfice bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of andorhalical transcripts.
                                                                                                              strongly promoted by thrombomodulin.

TISSUE SPECIFICITY: Plasma; synthesized in the liver.

PIM: The vitamin K-dependent, enzymatic carboxylation of sresidues allows the modified protein to bind calcium.

MISCELLANEOUS: Calcium also binds, with stronger affinity another site, beyond the GLA domain. This GLA-independent site is necessary for the recognition of the thrombin-
                                                                                                                                                                                                                                                                                                                                     FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholipids.

CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va
                                                                 SIMILARITY: Belongs to peptidase family SIMILARITY: Contains 2 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                359

Mol. Life Sci. 58:148-159(2001).

FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholipids.

CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBUNIT: Synthesized as a single chain precursor, which is cleaven to a light chain and a heavy chain held together by a disulfict bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: Belongs to peptidase family S1. SIMILARITY: Contains 2 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              residues allows the modified protein to bind calcium.
MISCELLANEOUS: Calcium also binds, with stronger affinity to
another site, beyond the GLA domain. This GLA-independent bin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            strongly promoted by thrombomodulin.
TISSUE SPECIFICITY: Plasma; synthesized in the liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and VIIIa

-!- FUNCTI
residues allows the modified protein to bind calcium.

In MISCELLANEOUS: Calcium also binds, with stronger affinity to another site, beyond the GLA domain. This GLA-independent binding site is necessary for the recognition of the thrombin-thrombomodulin complex.

ENTITIARITY: Belongs to peptidase family $1.
                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eut

                                                                                                            SUBUNIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin.
                                                                                                                                                                                                                 n.L., He X., Dahlback B.;
mitted (FEB-1996) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholipids.
CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va
                                                                                        strongly promoted by Liromounders.
TISSUE SPECIFICITY: Plasma; synthesized in the liver.
                                                                                                                                                                                                  and VIIIa.

C;Comment: This protein plays a critical role in blood coagulation.
C;Comment: This protein factor; EGF homology; Gla domain homology; trypsin homology
C;Superfamily: coagulation factor; EGF homology; Gla domain homology; trypsin homology
C;Superfamily: coagulation acid; blood coagulation; calcium binding; carboxyglutam
C;Keywords: beta-hydroxysaspartic acid; blood coagulation; calcium binding; carboxyglutam
